$\qquad$

LEARNiNG $\checkmark \quad$ I can simplify ratios.
(-)
$\checkmark \quad$ I can use ratios to solve geometric applications
I can solve real world problems by writing and solving proportions.

## Vocabulary:

- A ratio is a comparison of two quantities using division. The ratio $a$ to $b$, where $b$ is not zero, can be written as $\frac{a}{b}$ or $a: b$.
- A proportion is an equation in which two ratios are equal. For example, $\frac{a}{b}=\frac{c}{d}$ is an example of a proportion. The numbers $b$ and $c$ are called the means and the numbers $a$ and $d$ are called the extremes.
$\rightarrow$ The truth of a proportion can be tested by using the Cross Products Property, which states: If $\frac{a}{b}=\frac{c}{d}$, where $b \neq 0$ and $d \neq 0$, then $a d=b c$ (also known as product of means = product of extremes).

## I can simplify ratios.

In order to simplify ratios, the units must be the same. You may need to multiply the given ratio by a conversion factor to make the units cancel out!

## Example1:

a) $42 \mathrm{~cm}: 6 \mathrm{~cm}$
b) $\frac{4 \mathrm{ft}}{12 \mathrm{in}}$
c) $45 \mathrm{~min}: 1$ hour

## I can use a ratio to find a dimension.

You are painting some barn doors. You know that the perimeter of the doors is 64 feet and that the ratio of the length to height is 3:5. Find the area of the doors.
a) Step 1: Write equivalent ratio
b) Step 2: Set up and solve equation to find $x$.
c) Step 3: Evaluate the equivalent expressions for length and width.
d) Step 4: Answer the question - find area!

## $\checkmark$ I can use extended ratios to solve problems.

An extended ratio compares more than 2 items.

## Example 3:

a) The measures of the angles in $\triangle A B C$ are in the extended ratio of 2:3:4. Find the measures of the angles. Step 1: Write an equivalent ratio for the given ratio.

Step 2: Draw and label a diagram using the given information.

Step 3: Set up and solve an equation to find $x$.

Step 4: Answer the question!

## $\checkmark$ I can use ratios and proportions to solve real-world problems

A scale is a ratio that describes how the dimensions in a drawing are related to the actual dimensions of the object. scale $=\frac{\text { dimension in drawing }}{\text { actual dimension }}$

## Example 4:

a) The blueprint below shows a scale drawing of an MP3 music player. The diameter of the round speaker on the blueprint is 0.4 inch. The actual length is 1.6 inches. What is the scale of the blueprint?

b) The scale of a map is $1 \mathrm{in}: 1440 \mathrm{ft}$. Find the actual length of the street if the distance on the map is 3 inches.
