- I can identify special angle pairs.
- I can find measures of complementary and supplementary angles.
The graphic organizer below outlines the different possibilities for a pair of angles.

## Example 1: Use complements and supplements

a) The measure of an angle is twice the measure of its complement. Find the measure of each angle.
b) $\angle A$ and $\angle B$ are complementary angles. $\angle C$ and $\angle D$ are supplementary angles. Find the measures of the four angles, if $m \angle A=2 x^{\circ}, m \angle B=6 y^{\circ}, m \angle C=(6 x+y)^{\circ}$, and $m \angle D=(4 x+2 y)^{\circ}$

| Linear Pair Postulate (LPP) |  |  |  |
| :--- | :--- | :---: | :---: |
| If two angles form a linear pair, then they are |  |  |  |

## Example 2: Use the Linear Pair Postulate

a) Solve for $x$ in the diagram.

b) Find the values of $x$ and $y$ in the diagram.

Extension...find the measures of the angles in example 6b, what do you notice about the measures of the vertical angles?

| Vertical Angles Theorem (VAT) |  |
| :--- | :--- |
| Vertical angles are congruent. | $\angle 1 \cong \angle 3$ and $\angle 2 \cong \angle 4$ |

## Example 6: Use the Vertical Angles Theorem.

7) a) Find the value of $x$ and the measure of each angle in the diagram below.

b) Find the values of $x$ and $y$, and then find the measure of each angle in the diagram below.

Putting it all together!
8) a) Find the values of $x, y$, and $z$, and then find the measure of each angle in the diagram below.
